

Low Voltage Fuses

European NH Knife Blade Fuse System

SIBA LV fuse links incorporates a dual indicator for visual blown fuse are available in a large variety of voltage ratings, body sizes and operating classes.

Sizes;	000, 00, 0, 1, 2, 3, 4, and 4a
Voltage Ratings;	400V _{AC} , 500V _{AC} /220V _{DC} /440V _{DC} 690V _{AC} , 1000V _{AC} , 1500V _{AC}
Operation Class;	gG - Full range breaking capacity for general applications.
	gB - Full range breaking capacity for mining applications.
	aM - Partial range breaking capacity for motor circuit protection.
	gTr - Full range breaking capacity for transformer protection.
	gTF - Full range breaking capacity for general applications.
Standards;	IEC 60269-1 & 2, EN 60269-1 & 2 VDEN0636 PART 1 & 2 VDE 0636 part 2011 DIN 43620

Features and Benefits

- High interrupt current rating to 120KA
- Low power loss and low temperature rise
- All fuse links contacts are corrosion resistant
- Gripping lugs: metal/live for standard application, metal/insulated for improved safety

Low Voltage Fuses

European NH Knife Blade Fuse System

General

User's demand for maximum service reliability in low voltage networks coupled with effective and economic operation places considerable requirements on the quality of protective gear used in the electrical networks. SIBA's continuous advances in development and quality of their LV fuse links are preferred for use in feeder line protection. When SIBA LV fuse links are suitably selected to match the line characteristics, they provide the maximum protection against all faults that are generally encountered. The fuse current rating range is capable of protecting small over currents up to its rated breaking current.

Design

SIBA fuse links are built to the highest standards, this is met by utilizing the highest quality materials, the most highly automated construction techniques and a work force that has an ongoing training program for maintaining and improving the quality of its products. The fuse link is constructed of, the main body is a high quality ceramic, the fuse elements are directly spot welded to the contacts of the knife blades. For most fuse links, a dual indicating system is incorporated, the standard flap type that is on the faceplate and the other that is on the top and center of the ceramic body for a more direct viewing.

Technical Data and Explanations

Current Limiting

The thermal and dynamical capacity of electrical switchgear components are determined by the peak value of the prospective short circuit current I_s . The magnitude of this peak short circuit current I_s is a value that is dependent on the rms value of prospective short circuit current I_p and the phase angle of fault occurrence that induces a DC offset. Due to current limiting, high short circuit fault currents do not rise up to their peak capability, when SIBA LV fuse links of the corresponding rated current are utilized.

The current limiting diagram shows the function of the prospective short circuit current I_s depending on the prospective current I_p (sym.r.m.s.). The coherence between the prospective current I_p (sym.r.m.s.) and the efficiency of current limitation (cut off current ID) by SIBA LV fuse links is given by the more flat running lines for the various fuse rated currents.

Time-Current Characteristics

The time-current characteristics for LV fuse links type gG are re-presented as "medium characteristics curves", these are within the cutoff range stipulated by VDE 0636-2. Maximum deviation in the current coordinates is $\pm 7\%$.

Fuse Discrimination

The discrimination between two fuse links of different current ratings can only be determined when considering the service voltage. The distance of discrimination in radially operated systems of 1:1.6, referred to the fuse link rated current, as well as the use of fuse links of the same rated current in meshed networks is only applicable at service voltages $1.1 \times U_n / \sqrt{3}$.

Low Voltage Fuses

European NH Knife Blade Fuse System

Characteristic Stability

SIBA LV fuse links are extremely resistant to aging. Long term overload tests according to VDE 0636 have proven that the cyclic load specified for such a test, applied for a period of 100 hours at a test current being equal to 1.15 times fuse rated current has been passed successfully without aging.

Arc Voltage

The arc voltage is considerably below the values specified by VDE 0636-2.

Class aM Fuse Links

SIBA's class aM LV fuse links are designed for the protection of switchgear in motor feeder applications. The special design of the melting element(s) provides reliable service in the limited range of the switchgear.

In the range above 4 times the fuse links rated current, SIBA LV aM class of fuse links provides protection of the thermal overcurrent relays and for short circuit current faults prevents contactor points from welding due to the extremely fast clearing time. The high breaking current rating capability of the aM fuse link required by such operation is safely archived by through low cut off currents.

Class gTr Fuse Links

SIBA's class gTr LV fuse links are designed with a specific T-C curve adapted to the load characteristics of the transformer. Therefore a better utilization of the transformers overload capacity is achieved. SIBA gTR transformer fuse links are capable of carrying 1.3 time the rated current of the transformer as a continuous load for a minimum of 10hours. At 1.5 times the transformers rated current as a continuous load the fuse operates within 2 hours. Characteristics per VDE 0636/2011.

Class gB Fuse Links

SIBA's class gB LV fuse links were developed to provide protection for underground installations of the mining industry, taking into consideration particularly the operating conditions for safety. Characteristics per VDE 0636/2011.

Class gG Fuse Links

SIBA's class gG LV fuse links with operating class gG are designed to protect cables and wires. The operating class gG corresponds with VDE 0636 part 2and IEC 60269-2. The particular shape and design of the elements assure low power loss.
